Perly Pay for PrestaShop

Perly Pay lets your customers pay with bitcoin, USDC or USDT, straight to your own wallet. Perly Pay never holds the money and never asks for a private key. It costs 2.5 cents a payment, never more than 0.5% of it, billed after the month; a month of up to 21 payments costs nothing.

Requirements: PrestaShop 8 or 9, PHP 8.1 or later with curl, a shop selling in USD or EUR, and a Perly Pay account (pay.perly.io) with your wallet's public keys connected.

Install

- Modules > Module Manager > Upload a module, and drop perlypay.zip.
- Press Configure.

Configure

- Secret key: in Perly Pay, Developers > API keys. Use sk_test_... to try it and sk_live_... for real money. Paste it and press Save.
- Press Set up webhook. It adds this shop's address in Perly Pay with the invoice and refund events and saves the webhook's secret. Then press Test connection: it should say the webhook is set up.
- Payment page: Redirect (the default) sends the customer to the payment page on Perly Pay. Overlay opens it over a page of your shop; for that, add your shop's address in Perly Pay > Settings > Sites that may embed the checkout.
- Open refunds in Perly Pay: on by default. A credit slip on an order paid with Perly Pay then opens a refund there.
- Debug log: ids and outcomes to Advanced Parameters > Logs. Never keys, secrets or customers' details.

Perly Pay bills in USD or EUR. Customers paying in another currency do not see the option; the settings page names those currencies.

What happens to an order

- The customer picks Pay with crypto and pays on the payment page. No order exists yet: it is made as soon as the money is on its way, for the amount Perly Pay billed.
- Awaiting crypto confirmation: the payment is on the network and not yet confirmed.
- Payment accepted: the payment is confirmed and the sender screened. The customer gets your shop's usual emails. A private message on the order names the network, the amount and the transaction.
- Crypto payment held: Perly Pay holds the payment for review, or it was made for another total than the order's. Decide in Perly Pay; ship only once the payment is accepted.
- Payment error: a payment was seen on the network but never arrived.
- Part payments, overpayments and payments that arrived after the invoice expired are written in the order's messages.

Refunds

Make a credit slip on the order (Partial refund, Standard refund or Return products). The module opens a refund in Perly Pay for the slip's amount, in the coin that was paid. Perly Pay emails the customer for an address and checks it; you then send the coins from your own wallet and paste the transaction id in Perly Pay. The order's messages say each step. A slip given as a voucher opens no refund.

Test without real money

With a sk_test_... key, place an order and pick Pay with crypto. Pay with test coins on the test networks, or mark the invoice paid with Perly Pay's simulator (POST /api/v1/invoices/{id}/simulate with your test key). Within seconds the order is Payment accepted.

Go live

Turn on live mode in Perly Pay and connect your wallet's public keys, paste a sk_live_... key, press Set up webhook again, then sell one small order for real and refund it with a credit slip. Perly Pay sends webhooks only to https addresses.

When something does not work

- The option is missing at checkout: the shop's currency is not USD or EUR, the secret key is not saved, or the module is not allowed for that currency, country or group in Payment > Preferences.
- Orders stay without a payment: press Test connection. The webhook must be set up and switched on in Perly Pay, and the shop reachable over https (maintenance mode blocks it too).
- Turn on Debug log and look in Advanced Parameters > Logs for lines starting "Perly Pay:".
